## SECTION 1

### PURPOSE AND SUMMARY OF TEST

#### PURPOSE

This rear impact test is sponsored by the National Highway Traffic Safety Administration (NHTSA) under contract number DTNH22-06-C-00030. The purpose of this test is to reduce deaths and injuries occurring from fires that result from fuel spillage during and after motor vehicle crashes and resulting from ingestion of fuels during siphoning.

#### SUMMARY

A 2008 Ford Taurus was impacted by a Moving Deformable Barrier (MDB) at a velocity of 79.5 km/h. The test was performed at MGA Research Corporation on September 12, 2008. Pre-and post-test photographs of the vehicle and dummies can be found in Appendix A.

One real-time camera and three high-speed cameras were used to document the impact event.

- Left Rear Half            1000 fps
- Right Rear Half         1000 fps
- Overhead Overall        1000 fps
- Real Time Pan            24 fps

Two ballast Part 572E, 50<sup>th</sup> percentile male anthropomorphic test devices (ATDs) were placed in the driver and right-front passenger seating positions according to dummy placement instructions specified in the Laboratory Indicant Test Procedure.

There was no Stoddard Solvent leakage after the event or during any phase of the static rollover.

The vehicle appeared to comply with all the requirements of FMVSS No. 301 "Fuel System Integrity."

**NORMAL DESIGN RIDING POSITION**

For both driver and passenger seat backs:  
The seat back angle is measured relative to the rockers sill. Remove the seat back panel and position the inclinometer as shown in the drawing, 13 inches above the back pivot point on the rear outboard seat frame. Avoid taking measurements on the reinforcement plates. If seat is equipped with SAB, take seat back angle measurement on inboard side or set seat back angle by achieving 6.4° (from vertical) at the headrest posts.

Driver Seat Back Angle	6.4° on headrest post
Passenger Seat Back Angle	6.4° on headrest post
